Recycled content of Trimo product

Climate change is one of the main concerns for Trimo. Together with our partners in the supply chain are striving for careful use of natural resources and energy, saving materials from landfill, thereby preventing or minimizing environmental pollution in the future.

Trimo products consist of mineral raw materials, mainly in the form of steel sheets and mineral wool. They contain recycled materials which help to reduce environmental impacts and support a circular economy.

The recycled content in our products meets these ISO 14021 definitions:

Pre-consumer material: Material diverted from the waste stream during a manufacturing process. Excluded is reutilization of materials such as rework, regrind or scrap generated in a process and capable of being reclaimed within the same process that generated it.

Post-consumer material: Material generated by households or by commercial, industrial and institutional facilities in their role as end-users of the product which can no longer be used for its intended purpose. This includes returns of material from the distribution chain.

The level of recycled content for our products is influenced by the use of material suppliers as well as the dimension of the panel. On the basis of these facts we hereby declare that the recycled content of Trimo product is as follows:

Product	Recycled content (LEED v4) (post-consumer content + ½ pre-consumer content)	Recycled content (ISO 14021) (post-consumer content + pre-consumer content)
Trimoterm FTV and FTV HL	At least 7%	At least 12%
Trimoterm SNV	At least 7%	At least 13%
Qbiss One	At least 7%	At least 13%
Qbiss Screen H/H+	At least 14%	At least 22%
Qbiss Screen MW	At least 15%	At least 27%

Precise recycled content information can be provided for the specified final product.

Should you require any further clarifications or information do not hesitate to contact us.
